ABSTRACT

This is for someone who will stop at your poster and read. They should be able to understand the idea without talking to you, so keep it tight and approachable. **Bold a surprising metric or claim** that makes people ask you a question.

- Lead with the abstract-level hook so curiosity kicks in.
- Use the nice graphics around the text to reinforce your main message.
- Mention qualitative wins or failure cases that invite discussion.
- Close with one sentence that suggests what they should do next (scan the QR, read the paper, etc.).

EXAMPLE

A short code snippet demonstrating the core idea. Swap losses, environments, or sampling methods with minimal code changes:

```python
import torch
from mylib import Environment
from mylib import PolicyNet

# Set up environment and model.
env = Environment(
    ndim=4, height=8
)
model = PolicyNet(
    input_dim=env.obs_dim,
    hidden_dim=256,
    output_dim=env.n_actions,
)
opt = torch.optim.Adam(
    model.parameters(), lr=1e-3
)

# Training loop.
for epoch in range(1000):
    traj = env.sample(model, n=16)
    loss = model.loss(traj)
    opt.zero_grad()
    loss.backward()
    opt.step()
```

This enables users to swap single elements of their training pipeline without changes to the rest of their code.

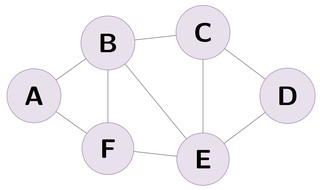

Figure 1: Placeholder graph.

Replace this TikZ figure with your main pipeline diagram or key result. Keep it large and central so it draws people in from across the room.

KEY RESULTS

- **Modular design:** easily swap components to facilitate rapid experimentation.
- **Broad support:** handles discrete, continuous, and graph-structured domains.
- **Best practices:** continuous integration, typing, tests, and documentation.

COMPARISON

	Ours	Base. A	Base. B
Acc.	**94.2**	91.7	89.3
F1	**0.923**	0.894	0.871
Lat. (ms)	**12.4**	15.8	22.1
Params (M)	3.2	4.1	5.7
